Use only after required functional, technical, field-usability, and approval gates are complete.

Control: Version 1.0 | Status Rough Draft | Author and Chief Editor: Matt Ramsey | Co-Editor: Todd Shoeff | Final Approver: Jeremy Thamert

TBT-05.03: Structural Steel Bolting & Torquing

CSI Division: Div 05 | Track Assignment: Track 2 Structural & Steel

DIRECTIVE

All structural connections must have at least two bolts wrenched tight before the load is released from the crane.

GENERAL ORDER

Impact wrenches must be tethered when used at heights. Keep fingers clear of bolt holes during alignment — use a spud wrench.

Key Hazards & Mitigation (The 'What If')

- Worker uses finger to check hole alignment — stop, use a spud wrench to prevent amputation.
- Impact wrench drops from steel — tether all tools when working aloft.
- Crane releases load early — do not signal release until two bolts are tight.

FIELD INSTRUCTION

Foreman: Inspect all tool tethers before the bolting crew ascends.
